System Requirements & Design Specifications

Security Service Web Page

Introduction:

Our website is constructed for a company providing security services. The purpose of this project is to create a professional and user-friendly platform where potential clients can learn about the services offered, explore important information, and easily get in contact with the company. The system is designed to allow users to navigate through different pages, view service details, and access features such as submitting inquiries or reviews. It focuses on providing a clear layout, simple navigation, and an overall efficient user experience.

Question:

How does a web-based system improve efficiency and customer experience in service-based businesses?

Who is Secured by Doh LLC?:

A service-based security company specializing in event and personal protection, which we collaborated with directly to design and develop this website.

System Requirements:

Functional requirements:

- Users can create an account
- Users can log in to existing accounts
- Admin users can log in through a separate authentication system
- Users can submit security service booking requests
- Users can submit reviews for services
- Admins can view all booking requests
- Admins can approve or deny booking requests
- Admins can provide a reason when denying a request
- System stores and retrieves user and booking data from a database

Design Specifications:

System architecture:

- Frontend (HTML, CSS, JavaScript)
- Backend (Python + Flask, werkzeug.security)
- Database (MariaDB managed with HeidiSQL)

User interface (UI) design:

- Single-column layout

Navigation:

- Home page
- About Us page
- Reviews page
- Sign-Up page
- Can lead to login page and admin login

Possible improvements:

- Update login system to improve security
- Add Google authentication/Firebase authentication
- Mobile Optimization
- Payment integration
- Email notifications to users and/or admin
